Individual Contribution Report

Student Name: Kyan Chris Po

Group: Shared Brain Cells

Assigned Role: CLI Developer

What did I contribute to the project?

I created the main.py which is the cli commenad prompt and command loop

What features did I personally develop?

I created the things like the help, date, time, exit commands for the cli so that people can use

What problems did I encounter?

I ran into multiple problems, but the most confusing one was the incorrect date and time format was the incorrect date and time format

How did I solve those problems?

For the exit I pretty much used a loop for its solution but for the date and time format? I researched it a bit more and found out I had to use python module which is "datetime”

What did I learn from this project?

What I learned in this project is patience. Heading into the project and working on it and running into tons of problems is going to test your patience with multiple failures and elimation processes. Sometimes it takes me awhile to solve a problem with something but I’ve always had a teammate, and I knew that I could as for their help or research about and solve it. But patience is really a core player that plays in when you see a problem you can’t solve for hours.

Evidence of my contribution:

```python
import os
import sys
from datetime import datetime

from users import login
from filesystem import FileSystem
from processes import ProcessManager
from memory import MemoryManager

OS_NAME = "Shared Brain Cell"
VERSION = "1.0"

COMMANDS = [
    "help", "clear", "date", "time", "whoami", "systeminfo", "exit",
    "dir", "mkdir", "create", "write", "read", "delete", "cd",
    "process", "run", "kill",
    "memory", "allocate", "free",
]

def banner():
    print("=" * 40)
    print(f"          {OS_NAME.upper()} v{VERSION}")
    print("=" * 40)
    print("\nWelcome to MiniOS!\n")

def need_arg(args, usage):
    if not args:
        print(f"Error: Missing argument. Usage: {usage}")
        return False
    return True

def to_int(text):
    try:
        return int(text)
    except ValueError:
        print("Error: Please enter a whole number.")
        return None

def main():
    user = login()
    if user is None:
        return
    fs, procs, mem = FileSystem(), ProcessManager(), MemoryManager()
    banner()

    while True:
        try:
            line = input(f"MiniOS{fs.location() if fs.path else ''}> ").strip()
        except (EOFError, KeyboardInterrupt):
            print()
```
